FOR BUSINESS

Control around every instruction.

Bring treasury requests, OTC review and operational accountability into a dedicated Exchange workspace.

Treasury

Understand the balance, the reservation and the proposed use of funds.

Team oversight

Prepare and approve through distinct, authorized roles.

OTC desk

Review size, price, fees and expiry before accepting a quote.

OTC WORKFLOW · TARGET MODEL

From request to agreed terms.

Exchange is the home for liquidity-provider relationships and quote validation.

Request

Specify the exact asset pair, direction, quantity and account.

Review

Check the provider terms, expiry, settlement route and costs.

Approve

Bind independent approval to the exact economic terms.

Execute

Exchange admits the accepted instruction and retains its result.

INDEPENDENT APPROVALS

Authority follows the request.

Selecting a company in a demonstration does not create real membership or signing authority.

Explicit roles

Account grants and organization membership must be verified.

Bound approvals

A change in price, size or recipient requires the applicable new review.

Safe retries

Repeated delivery must not create a second execution or release uncertain reservations.

BANKING CONNECTIVITY

Banking requests. Exchange executes.

A banking asset trade or yield-swap request goes to Exchange for execution and validation.

Banking

Owns its customer experience and submits an authorized request.

Exchange

Owns admission, liquidity connectivity and execution lifecycle.

Core / MPC

Preserve a single canonical balance across trade reservations and withdrawal requests.

Chain / Explorer

Provide the durable evidence path after the relevant accounting and publication steps.

RELEASE POSITION

A clear view of what is ready.

Use each capability in its actual release context. Product demonstrations are separate from financial services.

Available

Hybrid ID, workspace, full crypto catalogue, daily and selected intraday charts, and live USD references.

Demonstrations

Personal trading, business OTC, approvals and guided practice with fictional funds.

Connecting

Private Rust Testnet, canonical accounting, Kafka delivery and authenticated execution access.

Later products

Yield swaps, tokenized equities and barrier products need their own eligibility, liquidity and settlement acceptance.

DISCUSS YOUR WORKFLOW

Start with your operating model.

Define the accounts, assets, approval policy and settlement responsibilities your business needs.

Scope

Identify the client and treasury scenarios.

Controls

Agree the required permissions, limits and review points.

Acceptance

Prove connected behavior in the appropriate environment before live financial access.
